

Download: Please download ALL files including data files, code files, and test files. Note, as the maximal scale of each file is 20MB under github, data files are partitioned into a group of .zip files.

Decompression: The decompression results, files are: (i) four data files (stock.txt, trip.txt, normal.txt, uniform.txt). As the maximal space of a github user is 5GB, each data file contains 50M records; (ii) five c++ projects, each C++ project corresponds to an algorithm in the experiment;

Build: c++ projects could be compiled by VS 2019.

Run: .exe file, data file should be contained in the same file directory. Before testing, please change the name of the data files to "SourceFile.txt"(e.g., stock.txt-> SourceFile.txt). Query workload is automatically generated by the program.
